Moakley Park has the potential to become a pivotal landmark in Boston if it can appeal to everyone. Let’s make a park for ages 0-100! To achieve this, we need to consider how we construct buildings and infrastructure to control potential threats from rising tides. By changing the way we construct buildings and infrastructure, we can control potential threats from rising tides and create new ways to experience the environments where we live. We will be closer to the water—let’s get wet!

We propose adding topography constructed from dredging the channel in and from Carson Beach and the Harbor Islands to create new points of connectivity and infrastructure. These landforms will help to protect the overall experience from rising tides. The new dry zones will be connected and intersected by a series of lightweight scaffolded walkways that will function as elevated boardwalks across the site.
